ChimeMaps

An innovative geo-solution that uses advanced mapping techniques to provide actionable insights based on hospital, health, and population data.
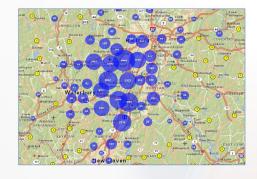

HOSPITALS ARE USING IT:

✓ ### To analyze their service lines.

Hospitals are strategically planning service line expansions by using ChimeMaps to identify the people who need their services and pinpointing where they live.

✓ ### To conduct market assessments.

Hospitals are gaining critical insight into how they perform in their markets in key service areas, how they compare to others, and how their markets are changing—helping them achieve future success.

✓ ### As their primary tool in conducting Community Health Needs Assessments.

Hospitals are eliminating their cumbersome, expensive, time consuming research process. ChimeMaps provides near real-time, relevant data that illustrates the true burden of health issues in their communities, provides statewide comparisons, and presents results in an easy-to-understand format.

✓ ### To target health interventions.

Hospitals are identifying high-frequency users by medical condition. They are targeting health outreach and interventions, resulting in reduced readmissions and measurable, improved community health.
